The mass spectra of nine saturated hydrocarbons with 5, 6 and 7 C atoms are studied in the temperature range between 100 and 900°C. For measurement the walls of the ionization zone of the ion source in which the gas to be studied is present under a pressure of ca. 10^{-3} Torr, can be heated to ca. 1000°C. Gold serves as the wall material. For one of the hydrocarbons (2, 2-dimethylbutane) an additional measurement was made of how the spectrum changes when the walls of the ionization zone are clad with a cracking catalyst. The catalyzed methane formation could be
